SymptoDoc

Problem Statement

In the current scenarios the patients experiencing health concerns often face difficulty in efficiently identifying the most appropriate medical professional for their specific symptoms.

Solution Statement

We propose a healthcare recommendation system that combines user-reported symptoms and doctor databases available. Users enter their symptoms, and the system uses Al to analyse the data and recommend doctors with matching specialities; then, our application provides the list of respective doctor specialists and provides the users with the facility of booking appointments according to their convenient schedules from anywhere. This can help users get the care they need faster and easier without surfing lots of the web.
